in differential geometry and topology one often deals with systems of partial differential equations as well as partial differential inequalities that have infinitely many solutions whatever boundary conditions are imposed it was discovered in the 1950s that the solvability of differential relations i e equations and inequalities of this kind can often be reduced to a problem of a purely homotopy theoretic nature one says in this case that the corresponding differential relation satisfies the h principle two famous examples of the h principle the nash kuiper C^1 isometric embedding theory in riemannian geometry and the smale hirsch immersion theory in differential topology were later transformed by gromov into powerful general methods for establishing the h principle the authors cover two main methods for proving the h principle holonomic approximation and convex integration the reader will find that with a few notable exceptions most instances of the h principle can be treated by the methods considered here a special emphasis is made on applications to symplectic and contact geometry the present book is the first broadly accessible exposition of the theory and its applications making it an excellent text for a graduate course on geometric methods for solving partial differential equations and inequalities geometers topologists and analysts will also find much value in this very readable exposition of an important and remarkable topic this second edition of the book is significantly revised and expanded to almost twice of the original size the most significant addition to the original book is the new part devoted to the method of wrinkling and its applications several other chapters e g on multivalued holonomic approximation and foliations are either added or completely rewritten
